DECORATIONS

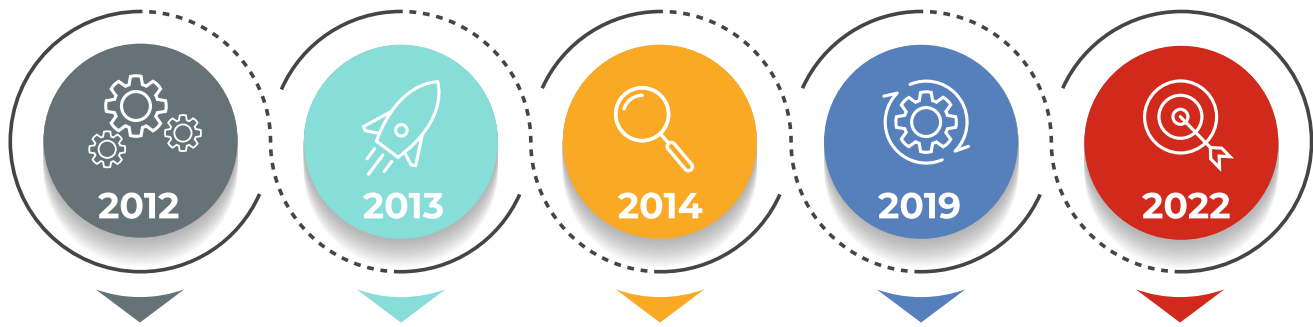

"Master's material, Masters of materials"

PRODUCT CATALOG

About Us

Empire Decorations takes great pride in representing Çukurova Polistren Dekor from the Netherlands and introducing exquisite decor pieces suitable for both indoor and outdoor spaces across the Caribbean. Since its establishment in 2012, Çukurova Polistren Dekor has consistently demonstrated its excellence, continually enhancing its offerings with innovative and stunning decorative pieces.

We are committed to providing homeowners with the opportunity to elevate their living spaces affordably and sustainably. Our products are designed to be user-friendly, akin to LEGO blocks, enabling anyone to unleash their creativity and become a true designer. Moreover, we offer the flexibility for interior builders to utilize our products seamlessly in their projects.

Start in Adana (Turkey) with a production hall of 2000m².

Rapidly became the favourite of numerous domestic and international consumers. Production hall scaled up to an impressive 7000m².

After a fire they managed to completely rebuild within 10 days and so continued to provide their services.

Following the significant success, a new factory was established.

Both domestic and international expansion continues to surge, buoyed by partnerships forged with global parties.

DESCRIPTION OF EPS

Expanded polystyrene hard foam is a petroleum-derived insulation material, composed of closed-cell foam thermoplastic. Known for its characteristic white color, this material provides effective insulation due to its closed pores.

The EPS (Expanded Polystyrene Hard Foam) product is created by expanding polystyrene particles using pentane gas and then bonding them together. This process results in the formation of foam. As the particles expand, small pores develop within the EPS. Subsequently, the pentane gas dissipates from the product, allowing air to fill the voids left behind. Thus, our EPS pieces consist of simplified structures, resembling stagnant air trapped within numerous closely packed porous cells (3.6 billion per cubic meter). 98% of the material is stagnant, dry air. The paramount concern is ensuring that production remains sustainable and minimally energy-intensive, despite the technical challenges. Apart from the mechanical strength, replacing the pentane gas with air also ensures that the product's performance remains stable throughout its lifespan. The thickness stays consistent, there is no increase in thermal conductivity, and the overall properties of the product do not deteriorate.

In the shaping phase, the last step in EPS production, the particles are blended together with precision to achieve a tight fusion. The high quality and successful execution of this process manifest in the honeycomb-like structures that become evident on the final product.

PLACES OF USE

Expanded polystyrene foam is commonly used to insulate sidewalls, terrace coverings, floors and basements against heat and cold. It is used for prefabricated building elements, commercial warehouses, expansion joints and rain gutters, cooling installations, glass packaging and further transportation of fragile products. Also used as molds in fisheries and for the overall decoration sector.

🏠 Address to be announced, Aruba

Descripción de EPS El poliestireno expandido es una espuma asadasadura derivada del petróleo, un material aislante compuesto por termoplástico de células cerradas. Conocido por su característico color blanco, este material proporciona una eficaz aislamiento debido a sus poros cerrados.

El producto EPS (Espuma Rígida de Poliestireno Expandido) se crea expandiendo partículas de poliestireno utilizando gas pentano y luego uniéndolas entre sí. Este proceso resulta en la formación de espuma. A medida que las partículas se expanden, se desarrollan pequeños poros dentro del EPS. Posteriormente, el gas pentano se disipa del producto, permitiendo que el aire llene los espacios vacíos que deja atrás. Por lo tanto, nuestras piezas de EPS consisten en estructuras simplificadas, que se asemejan a aire estancado atrapado dentro de numerosas células porosas densamente empaquetadas (3.6 mil millones por metro cúbico). El 98% del material es aire estancado y seco. La preocupación principal es asegurar que la producción permanezca sostenible y con un mínimo consumo energético, a pesar de los desafíos técnicos. Además de la resistencia mecánica, reemplazar el gas pentano con aire también garantiza que el rendimiento del producto permanezca estable a lo largo de su vida útil. El grosor se mantiene constante, no hay aumento en la conductividad térmica y las propiedades generales del producto no se deterioran.

En la fase de conformación, el último paso en la producción de EPS, las partículas se mezclan con precisión para lograr una fusión sólida. La alta calidad y la exitosa ejecución de este proceso se manifiestan en las estructuras similares a panal de abeja que se hacen evidentes en el producto final.

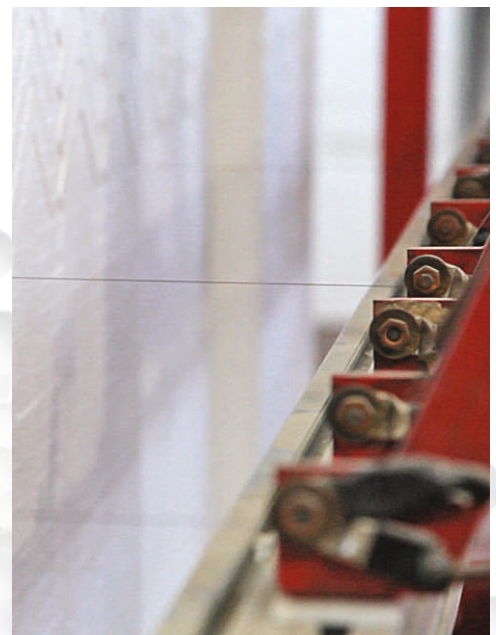

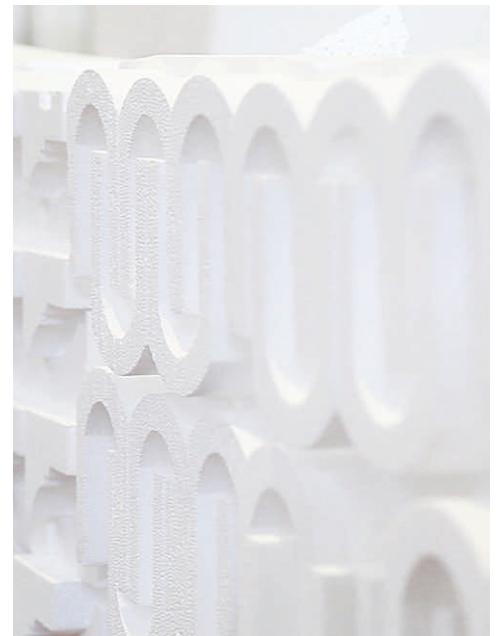

Lugares de aplicación La espuma de poliestireno expandido se utiliza comúnmente para aislar paredes laterales, cubiertas de terrazas, pisos y sótanos contra el calor y el frío. Se utiliza para elementos de construcción prefabricados, almacenes comerciales, juntas de expansión y canalones, instalaciones de refrigeración, envases de vidrio y para el transporte de productos frágiles. También se utiliza como moldes en la pesca y en el sector de la decoración en general.

Beschrijving van EPS Uitgebreid polystyreen hard schuim is een isolatiemateriaal afgeleid van aardolie, samengesteld uit thermoplastisch schuim met gesloten cellen. Bekend om zijn kenmerkende witte kleur, biedt dit materiaal effectieve isolatie vanwege zijn gesloten poriën.

Het EPS (Expanded Polystyrene Hard Foam) product wordt gecreëerd door het expanderen van polystyreendeeltjes met behulp van pentaangas en ze vervolgens aan elkaar te binden. Dit proces resulteert in de vorming van schuim. Naarmate de deeltjes uitzetten, ontwikkelen zich kleine poriën binnen het EPS. Vervolgens vervliegt het pentaangas uit het product, waardoor lucht de achtergebleven holtes kan vullen. Onze EPS-stukken bestaan dus uit vereenvoudigde structuren, die lijken op stilstaande lucht die gevangen zit binnen talloze dicht op elkaar gepakte poreuze cellen (3,6 miljard per kubieke meter). 98% van het materiaal is stilstaande, droge lucht. De belangrijkste zorg is ervoor te zorgen dat de productie duurzaam blijft en minimaal energie-intensief, ondanks de technische uitdagingen. Afgezien van de mechanische sterkte zorgt het vervangen van het pentaangas door lucht er ook voor dat de prestaties van het product stabiel blijven gedurende de levensduur ervan. De dikte blijft consistent, er is geen toename in thermische geleidbaarheid en de algehele eigenschappen van het product verslechteren niet.

In de vormfase, de laatste stap in de EPS-productie, worden de deeltjes nauwkeurig samengevoegd om een strakke fusie te bereiken. De hoge kwaliteit en succesvolle uitvoering van dit proces manifesteren zich in de honinggraatachtige structuren die zichtbaar worden op het eindproduct.

Toepassingsgebieden Uitgebreid polystyreenschuim wordt veel gebruikt om zijwanden, terrasbedekkingen, vloeren en kelders te isoleren tegen warmte en kou. Het wordt gebruikt voor prefab bouwelementen, commerciële magazijnen, dilatatievoegen en regenafvoeren, koelinstallaties, glasverpakkingen en verdere transport van breekbare producten. Het wordt ook gebruikt als mallen in de visserij en voor de algemene decoratiesector.

High-density EPS (Expanded Polystyrene) products are crafted through shaping polystyrene, followed by the application of acrylic-based resin formed by blending various chemicals.

Los productos de EPS (poliestireno expandido de alta densidad) se elaboran mediante el moldeo de poliestireno, seguido por la aplicación de resina acrílica formada por la mezcla de varios productos químicos.

Hoogwaardige EPS (Geëxpandeerd Polystyreen) producten worden geproduceerd door eerst polystyreen te vormen en vervolgens een op acryl gebaseerde hars aan te brengen die is samengesteld uit verschillende chemicaliën.

METER AAN PERFECT MATERIAAL

4 metre

We've engineered our technology to enable the production of all our outdoor products in lengths of up to 4 meters. This innovation allows for seamless assembly of these pieces without the need for any additional components. Due to our products being crafted from flexible raw materials, there is no risk of structural fractures within the component.

Hemos diseñado nuestra tecnología para permitir la producción de todos nuestros productos para exteriores en longitudes de hasta 4 metros. Esta innovación permite el montaje sin problemas de estas piezas sin necesidad de componentes adicionales.

Debido a que nuestros productos están fabricados con materiales crudos flexibles, no hay riesgo de fracturas estructurales dentro del componente.

We hebben onze technologie ontwikkeld om al onze buitenproducten te kunnen produceren in lengtes tot wel 4 meter. Deze innovatie maakt het mogelijk om deze stukken naadloos in elkaar te zetten zonder de noodzaak van extra onderdelen. Vanwege het feit dat onze producten vervaardigd zijn uit buigzame grondstoffen, is er geen risico op structurele breuken binnen het onderdeel.
